

Procedural City Generator

Functionality

The Procedural City Generator allows you to dynamically arrange both your own modeled buildings or roads, as well as the package's pre-made assets, into a city layout with a single click. It ensures correct placement of spaces, road transitions, traffic lights, warning signs, and designated green areas.

Package Content

- 12 buildings (1 fully modeled, 11 optimized and AI-refined models)
- 1 optimized and AI-refined bridge
- 4 optimized and AI-refined props
- 4 fully modeled road assets

Technical Features

All buildings, roads, and props are optimized and include PBR materials for high-quality rendering.

Usage

Usage:

Assets => ProceduralCityGenerator => Prefabs => City Generator => Drag the Procedural City Generator prefab into your scene, and you are ready.

Feel free to add your own buildings or roads. To modify, adjust the children inside `Tile_BuildingsAndRoads`. If you want to create from scratch, set `'isBuilding = true'` in `TileR.cs` for the building section, and make sure buildings and roads are facing the correct directions.

Building Function Collapse - Variables

- `size`: Defines the grid or city size for generation.
- `tileObjects`: Array of `TileR` objects used as building/road tiles.
- `cellPrefab`: The `CellR` prefab used to instantiate individual cells.
- `buildingBackupTile`: Backup `TileR` array in case no suitable building tile is available.
- `buildingDensity`: Controls how dense the buildings are placed within the city grid (default 0.8, range 0.7 - 1.0).
